

What is FRICTION

If two bodies are in contact with one another, the force exerted between them at their point of contact opposing the motion of one body to the another body is called friction and the force exerted is known as force of friction.

The friction is a force distribution at the surface of contact and acts tangential to the surface of contact.

Importance of FRICTION

Disadvantage The friction plays a very important role in many engineering applications. Friction is quite undesirable in many engineering applications, in which it would cause loss of power, wearing out of parts and huge economic losses, such as

- i) Bearings and gears
- ii) Flow of fluids in pipes
- iii) Power screw.

In many other engineering applications, friction is quite necessary as their working is very much dependent on friction. Such as

- i) Brakes and clutches
- ii) Belt and rope drive.

Types of Friction

- a) DRY FRICTION
- b) FLUID FRICTION
- c) STATIC FRICTION
- d) DYNAMIC FRICTION OR KINETIC FRICTION

DRY FRICTION OR COULOMB'S FRICTION

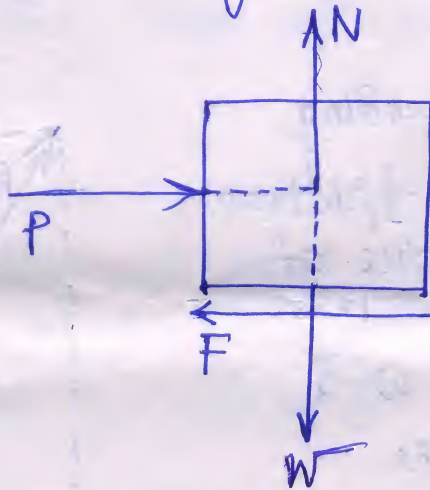

This type of friction is encountered between the surfaces of two rigid bodies when there exists a sliding motion or there is a tendency of motion in the absence of any oil or lubrication in between. The dry friction is present even if ~~there~~ there is no motion, under the condition of impending motion and when there is motion. It is also called Coulomb's friction, named after the scientist Coulomb who had carried out several experiments in this domain to realise the theory in its present form.

Laws of Friction

Coulomb presented summarised outcome of a large number of experiments related to dry friction that become famous as Coulombs Laws of friction or simply Laws of friction, which are as following

- The total force of friction that can be developed is independent of magnitude of area of contact.
- The total force of friction that can be developed is proportional to the normal reaction transmitted ~~ac~~ across the surface of contact.
- For low relative velocities of sliding, the total force of friction is practically independent of velocity.

~~conclusion of~~

Conclusion of Law (b) can be mathematically represent as

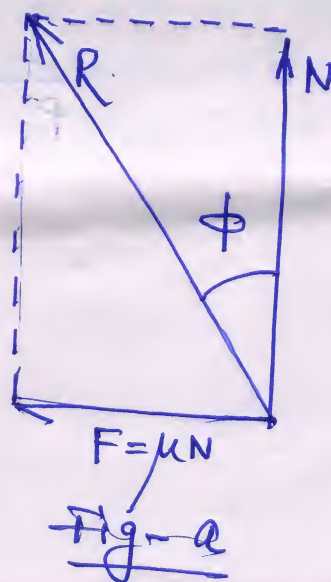

$$F \propto N \quad \left| \begin{array}{l} \text{where} \\ F \Rightarrow \text{Frictional force} \\ N \Rightarrow \text{Normal reaction} \\ P \Rightarrow \text{applied force} \\ W \Rightarrow \text{Self Weight} \end{array} \right.$$

or, $F = \mu N$

Here the constant of proportionality ~~defined~~ (μ) defined as co-efficient of friction. In static condition it is expressed as μ_s and for dynamic condition μ_k . For same set of contact surfaces, it has been observed that μ_k is almost 75% of μ_s .
(Friction force better to be shown with half arrow as it is a sort of shear force)

Angle of Friction

At the time of impending motion, the force of friction F is defined as force of limiting friction. In this condition the Fig-a will illustrate as how the resultant of normal reaction N and force of limiting friction F

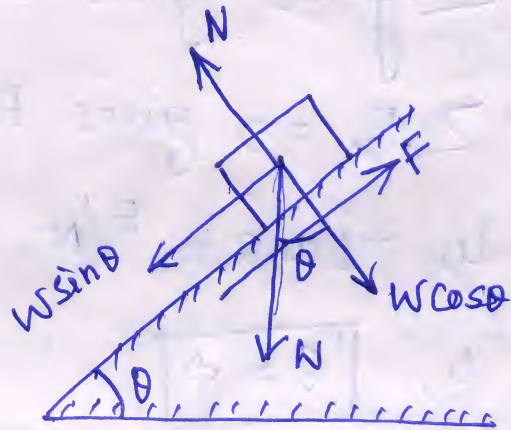

can be obtained. If the resultant force R makes an angle (independent of magnitude of area of contact) ϕ with normal reaction N

$$\tan \phi = \frac{\mu N}{N} = \mu$$

Here this angle ϕ is defined as limiting angle of friction or simply the angle of friction.

Angle of Repose

Let us consider a block of weight W resting on an inclined plane which makes an angle θ with the horizontal plane. When θ is small the block will rest on the plane. If θ is increased gradually a stage is reached at which the block starts sliding. This angle is called the angle of repose betⁿ two contact surfaces.

Thus the max^m inclination of the plane on which a body, free from external forces, can repose (sleep) is called Angle of repose. The block is in equilibrium under the action of the following forces,

- (a) Weight of the block w
- (b) Normal force N
- (c) Frictional Force $F (= \mu N)$

In the limiting condition. When the block is about to slide down the inclined plane, the frictional force must act up the plane for equilibrium.

$$\sum F_y = 0 \text{ gives } N = w \cos \theta$$

$$\sum F_x = 0 \text{ gives } F = w \sin \theta$$

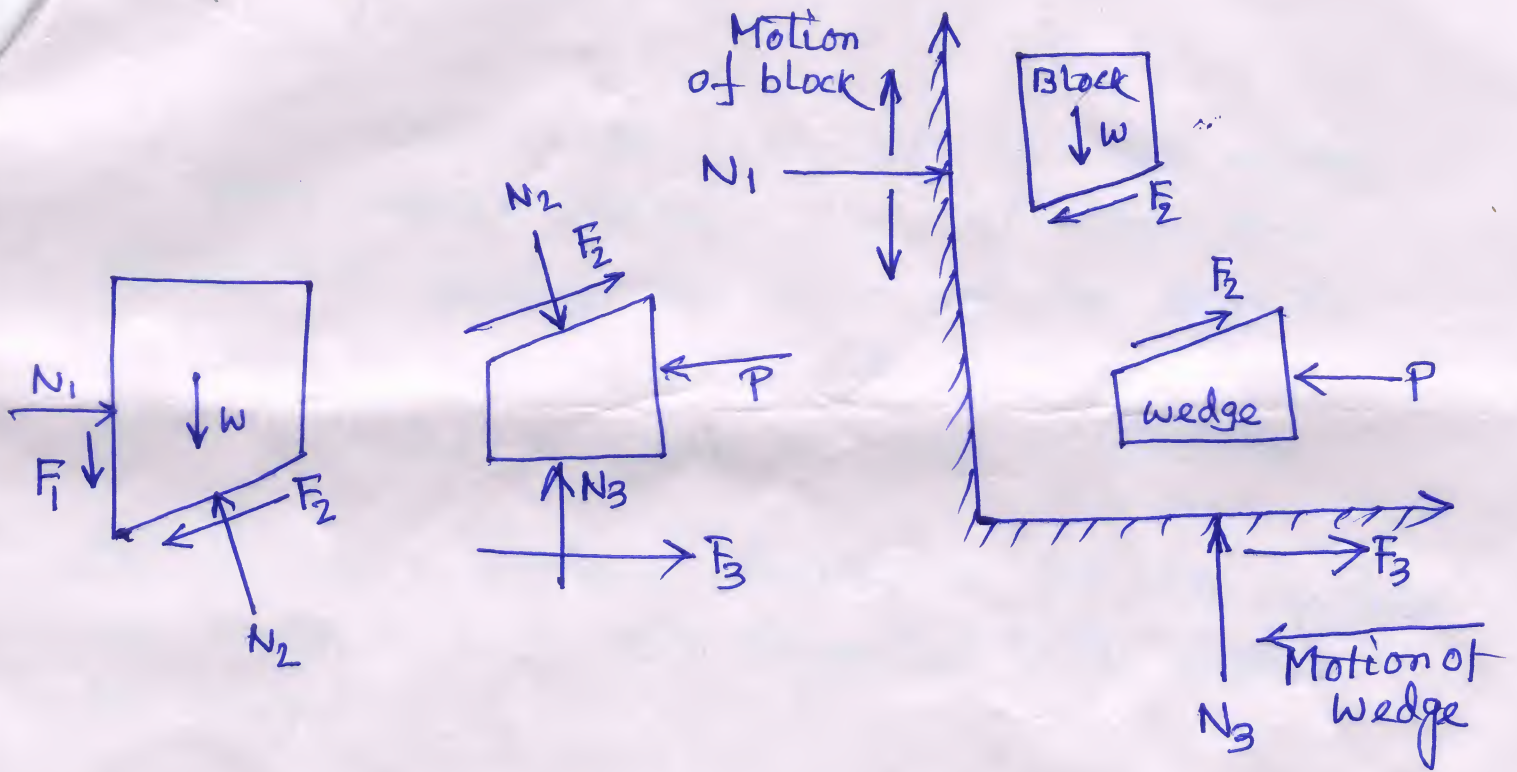

$$\therefore \tan \theta = F/N = \mu = \tan \phi$$

$$\therefore \boxed{\theta = \phi}$$

∴ The value of angle of repose is the same as the value of limiting angle of friction.

Wedge Friction

A-7

A wedge is a piece of metal or wood in the shape of a prism whose section is usually triangular or trapezoidal. Wedges are very simple machines, those are most useful in lifting or moving heavy loads. When lifting or moving heavy loads, the wedge is placed below the load and a horizontal force P is applied. The wedge moves towards left and the load moves upward.

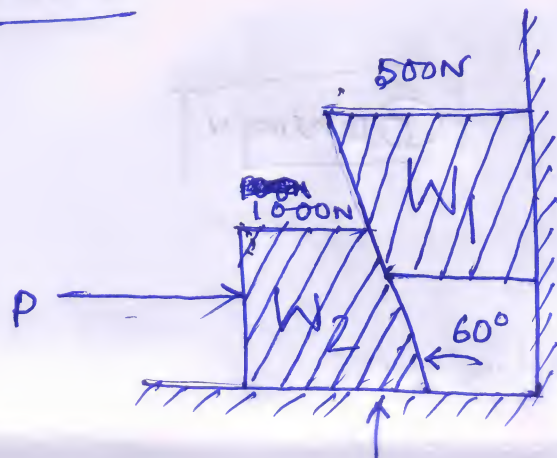

$\mu_1 \Rightarrow$ coefficient of friction betⁿ wall and the block
 $\mu_2 \Rightarrow$ " " " " block and wedge
 $\mu_3 \Rightarrow$ " " " " wedge and floor
 $W \Rightarrow$ weight of the wedge.

Numerical Example (Friction)

P-1

Prob-1

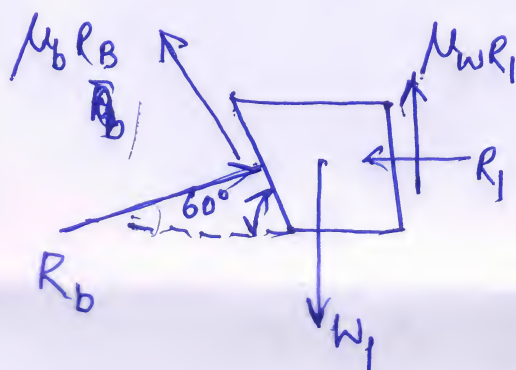

Banerjee

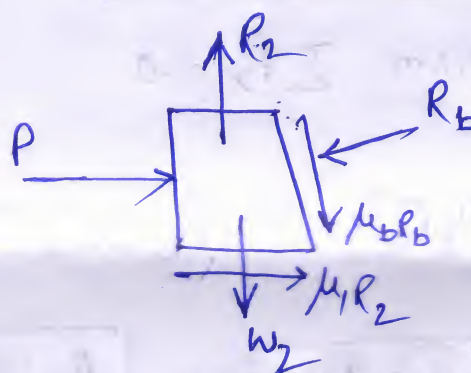

Co-efficient of friction (μ) at floor is 0.25, Co-efficient of friction at wall (μ_w) = 0.30 Co-efficient of friction betⁿ blocks (μ_b) = 0.20 Find min^m P to hold the system in equilibrium.

Soln

FBD of W_1

FBD of W_2

Now From FBD of block W_1 ,

$$\sum F_x = R_b \cos 30^\circ - \mu_b R_b \cos 60^\circ - R_1$$

$$\therefore R_b \cos 30^\circ - \mu_b R_b \cos 60^\circ - R_1 = 0$$

$$\therefore \boxed{R_1 = 0.766 R_b} \quad \text{--- (1)}$$

$$\text{again } \sum F_y = \mu_b R_b \sin 60^\circ + \mu_w R_1 + R_b \sin 30^\circ - W_1$$

$$\therefore \mu_b R_b \sin 60^\circ + \mu_w R_1 + R_b \sin 30^\circ - W_1 = 0$$

P-2

OR, $\boxed{0.637 R_b + 0.3 R_1 = 500} \quad \text{--- (2)}$

Now from equⁿ (1) and (2)

$\boxed{R_b = 553.8 \text{ N}}$

Banerjee

From FBD of Block W_2

\therefore From the condition of equilibrium

$\Sigma F_x = 0$ and $\Sigma F_y = 0$

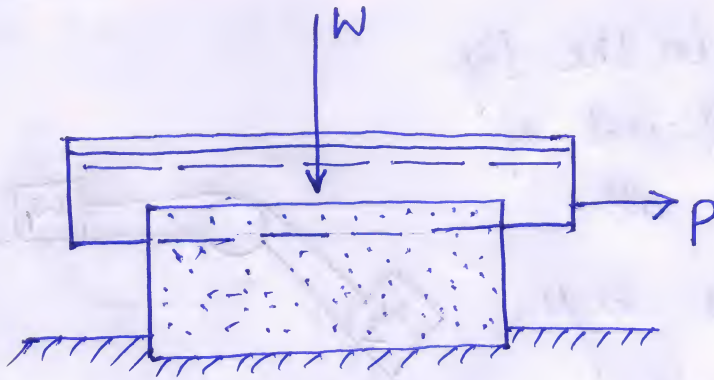

Now $\Sigma F_y = R_2 - R_b \sin 30^\circ - \mu_b R_b \sin 60^\circ - N_2 = 0$

~~or~~ $\boxed{R_2 = 1372.7 \text{ N}}$

again from $\Sigma F_x = 0$

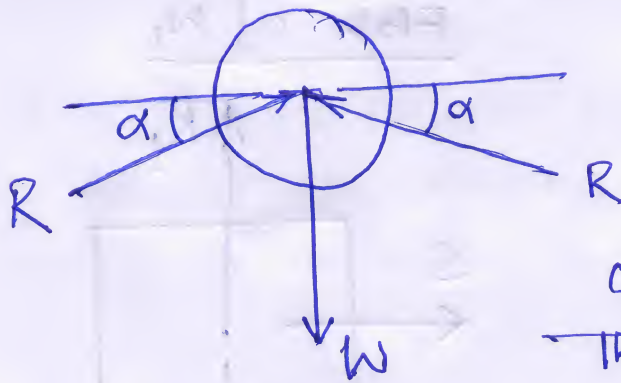

$P + \mu_b R_2 + \mu_b R_b \cos 60^\circ - R_b \cos 30^\circ = 0$

i.e., ~~$\boxed{P = 2000 \text{ N}}$~~ $\boxed{P = 80.8 \text{ N}}$

Q. For the problem in the above fig, find magnitude of P causing motion of cylinder to impend.

Solⁿ

From symmetry we can say that the reaction

coming from notch on the cylinder on ~~either~~ either side will be equal.

Considering equilibrium of cylinder,

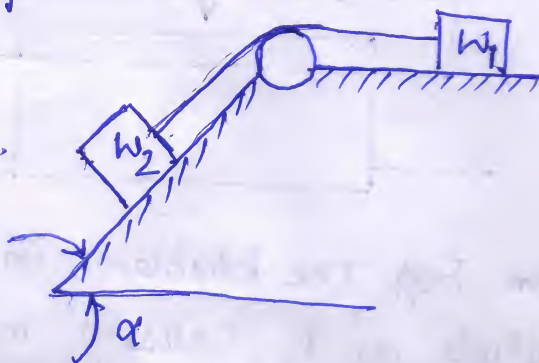

$$2R \sin \alpha = W$$

$$R = \frac{W}{2 \sin \alpha}$$

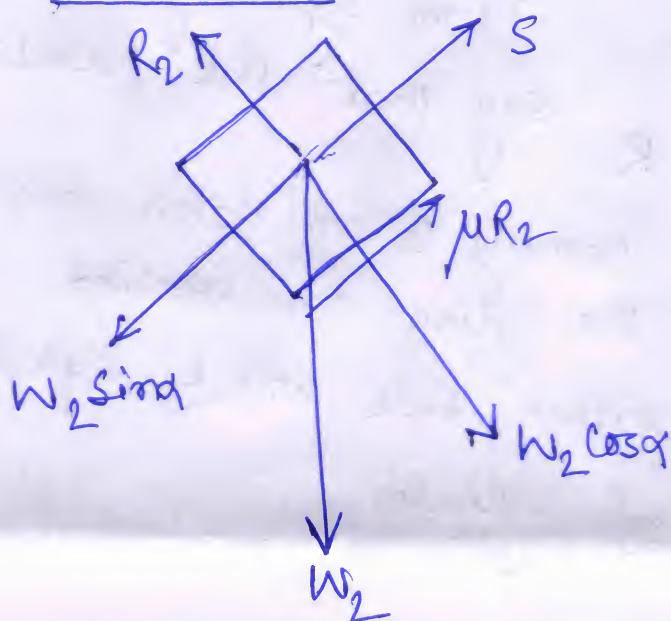

As the horizontal friction force induced on inside ~~top~~ surface of notch be $F = \mu R$ on either side

$$P = 2F = 2\mu R = \frac{\mu W}{\sin \alpha}$$

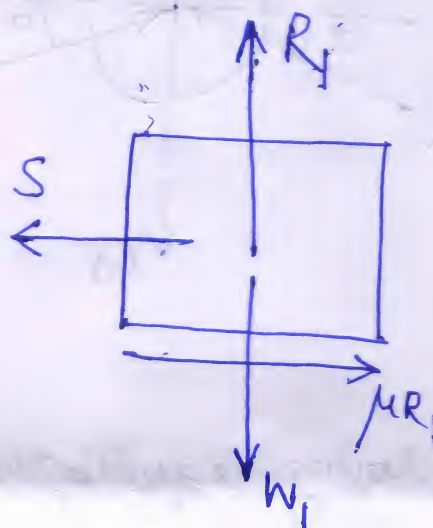

3. For the problem in the fig $W_1 = W_2$ and co-efficient of static friction for all contiguous surfaces is μ . Find α for impending motion. Consider pulley frictionless.

Sol^m FBD of W_2

FBD of W_1

Now from FBD of W_2

$$R_2 = W_2 \cos \alpha$$

$$\text{and } S + \mu R_2 - W_2 \sin \alpha = 0$$

$$\begin{aligned} \text{i.e., } S &= W_2 \sin \alpha - \mu R_2 \\ &= W_2 \sin \alpha - \mu W_2 \cos \alpha \end{aligned}$$

From FBD of N_1 ,

$$S = \mu R_1 = \mu W_1$$

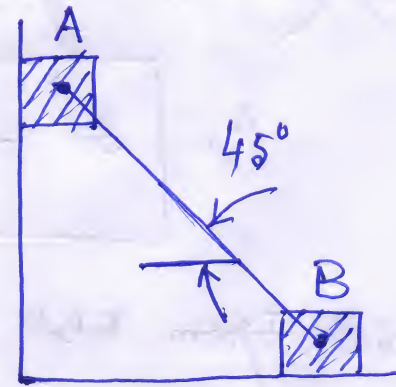

$$\text{ii, } \boxed{W_1 = W_2}$$

$$\mu = (\sin \alpha - \mu \cos \alpha)$$

$$\boxed{\mu = \tan(\alpha/2)}$$

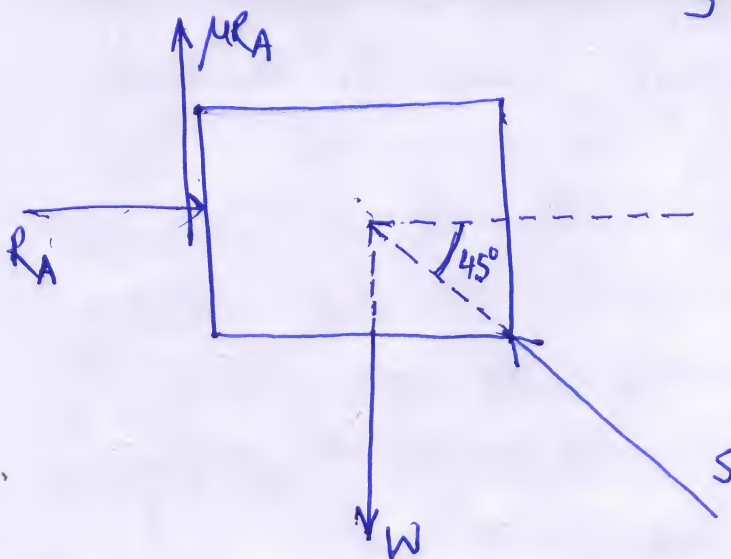

4

Find μ where the two blocks are identical.

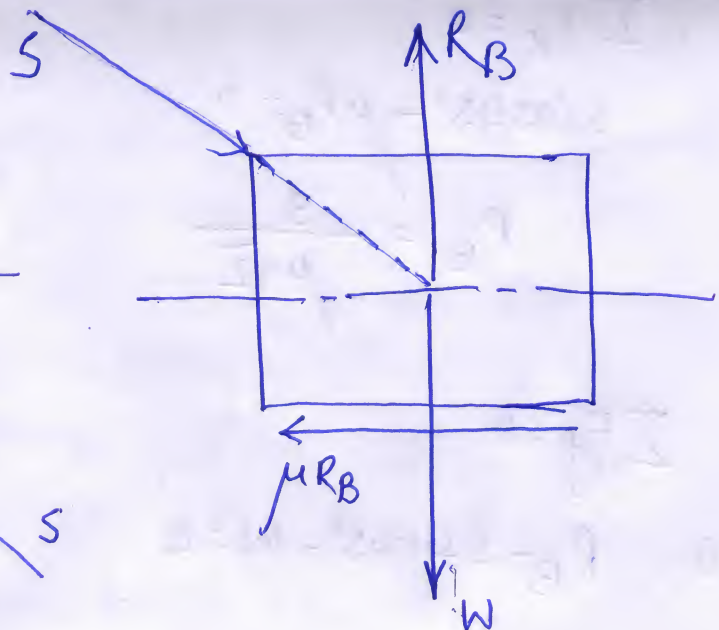

Soln

FBD of block A

FBD of block B

R_b

Now From FBD of block A
considering equilibrium

$$\Sigma F_x = 0$$

$$\text{i.e., } R_A = S \cos 45^\circ$$

$$\text{again } \Sigma F_y = 0$$

$$\text{i.e., } (S \sin 45^\circ + \mu R_A - W) = 0$$

$$\text{i.e., } \boxed{S = \frac{\sqrt{2}}{1+\mu} W}$$

← (1)

again From FBD of block B
considering equilibrium

$$\Sigma F_x = 0$$

$$S \cos 45^\circ - \mu R_B = 0$$

$$R_B = \frac{S}{\mu \sqrt{2}}$$

$$\Sigma F_y = 0$$

$$\text{i.e., } R_B - S \sin 45^\circ - W = 0$$

$$\text{i.e., } \frac{S}{\mu\sqrt{2}} - \frac{S}{\sqrt{2}} - W = 0$$

$$\boxed{S = \frac{W \cdot \mu \sqrt{2}}{1 - \mu}} \quad \text{--- (2)}$$

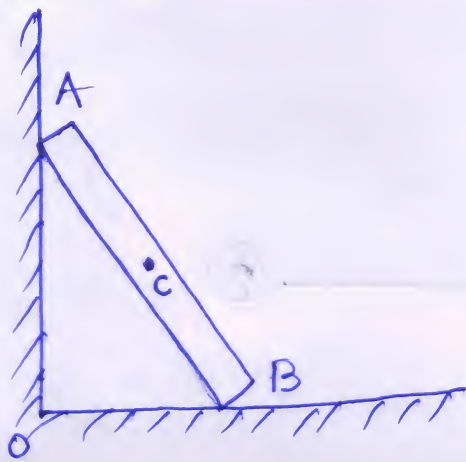

Equating (1) and (2)

$$\frac{1}{1 + \mu} = \frac{\mu}{1 - \mu}$$

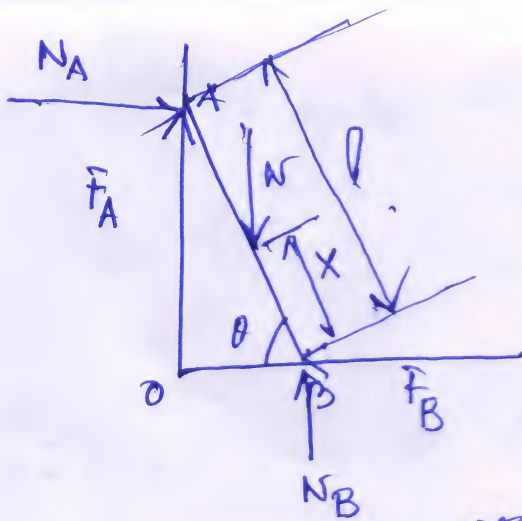

$$\text{OR, } \mu^2 + 2\mu - 1 = 0$$

$$\text{u, } \boxed{\mu = 0.414}$$

5 A ladder AB of length l carries a person of weight w and supported by a vertical wall at A and horizontal floor at B and makes an angle θ with the horizontal as shown in the fig. If the coefficient of friction betⁿ all the mating surface is μ , what is the location of the person along the length of the ladder as defined by position x for which there would not be any slippage?

Solⁿ

considering the equilibrium of the ladder

$$\sum F_x = 0$$

$$\therefore N_A - F_B = 0$$

$$\therefore \boxed{N_A = F_B} \quad \text{--- (1)}$$

$$\text{again } \sum F_y = 0$$

$$N_B - W + F_A = 0$$

$$\therefore \boxed{N_B = W - F_A = W - \mu N_A} \quad \text{--- (2)}$$

$$\sum M_B = 0$$

$$\therefore W x \cos \theta = N_A l \sin \theta + \mu N_A l \cos \theta = N_A l [\sin \theta + \mu \cos \theta] \quad \text{--- (3)}$$

Now comparing eqn^s ① and ②

$$N_A = \frac{\mu W}{1 + \mu^2}$$

Replacing N_A in eqn^s ③

$$W \times x \cos \theta = \frac{\mu W}{1 + \mu^2} l [\sin \theta + \mu \cos \theta]$$

$$\text{OR, } (x \cos \theta) (1 + \mu^2) = l [\mu \sin \theta + \mu^2 \cos \theta]$$

$$\text{OR, } x \cos \theta (1 + \tan^2 \phi) = l [\tan \phi \sin \theta + \tan^2 \phi \cos \theta]$$

$\left[\because \mu = \tan \phi \right]$
where ϕ is the
angle of friction

$$\text{OR, } x \cos \theta = l \sin \phi [\cos \phi \sin \theta + \sin \phi \cos \theta]$$

$$\text{OR, } x \cos \theta = l \sin \phi \sin (\theta + \phi)$$

$$\therefore \cos \phi \cos (\theta + \phi) + \sin (\theta + \phi) = \cos [\phi - (\theta + \phi)]$$

$$\therefore \sin \phi \sin (\theta + \phi) = \cos \theta - \cos \phi \cos (\theta + \phi)$$

$$\therefore x \cos \theta = l \sin \phi \sin (\theta + \phi) = l [\cos \theta - \cos \phi \cos (\theta + \phi)]$$

$$\text{Thus } x = \frac{l}{\cos \theta} [\cos \theta - \cos \phi \cos (\theta + \phi)]$$
